

Conditional Content

Show different content based on whether the output format is interactive (HTML) or non-interactive (PDF, Word) through the use of special classes `.interactive-only` and `.non-interactive-only`.

Demo

For example, you might want to include an interactive widget in HTML output, but provide a static message in PDF/Word.

```
 ::: {details summary="Interactive Demo"}

 ::: {interactive-only}
 <button onclick="alert('Hello!')">Click Me</button>
 :::

 ::: {non-interactive-only}
 *Button not available in this format. See the online version.*
 :::

 :::
```

This gives:

i Interactive Demo

Interactive button not available in this format. Visit the online documentation to try the demo.

You can see that in HTML output, the button is interactive, while in PDF/Word found under “Other Formats”, a placeholder message is shown instead.
